

# Confidential Pharmacy Logbook (Pharmacy Record Book) (Volume 4)

patient's medication when they are at home. Patient confidentiality needs to be maintained when speaking to carers or relatives.

Patients may bring a letter from the GP admitting them to hospital, which details their current medication. Unfortunately such letters are often incomplete and differ from information obtained by interviewing the patient. This may be due to a lack of awareness of what the patient is taking, often because the admitting GP is not the patient's own doctor or is part of an emergency on-call service. Details such as strengths or frequencies are often missing and sometimes individual drugs are completely missed off. GP letters alone should not be relied on and should be used in conjunction with other sources where possible.

Hospital records can be similarly inaccurate although a TTA form from a recent discharge, which has been seen by a pharmacist is likely to be reliable. Just be aware that the GP could have made changes or additions to the medication so use the TTA letter as a basis for your drug history.

When other sources have failed a telephone enquiry to the patient's GP or to the nursing home/community hospital from which they have been admitted will usually help to complete a drug history.

The key to obtaining a good drug history is to use a combination of information sources where possible and to remember the limitations and reliability of each information source consulted.
